Progressing external brickwork traditionally requires the use of a scaffold. Laying bricks from a scaffold still means that workers bend and stretch to do the work, which is also inefficient.

Mast climbers were used to provide bricklayers with access and working platform. This allowed the platform height to be precisely controlled so that the workers could lay bricks at the most comfortable and productive height.

Mast climbers have gone a long way and are coming back strong, not only for the masons but various trades find that the controlled access to increase productivity and reduce safety cost in the overall project
